Software Architecture AutoCAD's software architecture is typical for a platform-independent graphical software application. At the application level, the architecture is two-tiered. The client layer is used by the user interface. At the server layer, AutoCAD's user interface is managed by the application service provider (ASP). The following diagram shows AutoCAD's application architecture, with the business logic that implements the application rules packaged into an AutoCAD extension module. Client layer: AutoCAD User Interface The application's user interface is implemented in a.NET-based, Microsoft Windows (Windows) GUI (graphical user interface). .NET is a high-level software framework designed for building cross-platform, object-oriented GUI applications. It is based on the Common Object Request Broker Architecture (CORBA) specification for computer network-based distributed applications, and was designed to offer a set of standard classes for writing GUIs. For more information about.NET, see the.NET Reference Card. The application's user interface is based on the.NET Framework for Windows and the.NET Framework for Linux. The application's GUI is realized in the following way: The AutoCAD application's client is a separate executable module that runs in the foreground and is dedicated to displaying the GUI. This client does not talk to the application service provider (ASP). The GUI is an implementation of an abstract GUI model, which defines the visual appearance and behavior of all parts of the AutoCAD application. The GUI also includes implementation of the user interface logic, the logic that defines how the user interacts with the application and how the application responds to user input. ACDBASE In 1985 Autodesk began offering its own shareware Database Management System (DBMS), the ACDBASE, which was based on the classic DBMS called dBASE III. This offered some advantages over earlier products: it included its own drawing package, drawing mapping, was compatible with dBASE IIIs shareware products, and was not tied to a proprietary DBMS product (though the associated object relational DBMS ACAD was the DBMS used in the earlier applications for AutoCAD, e.g., N-Builder), although this was later abandoned. ACDBASE is still available, but discontinued. In 1986 Autodesk bought dBASE (then owned by Decision Support Systems, Inc.) and integrated it into AutoCAD. However, these products differed significantly from the dBASE III reference, and in the mid-1990s, Autodesk spun off the Application Program Interface (API) for ACAD and all other ACAD products as the ObjectARX API. However, the DBMS product line was integrated into the new product line. B-spline modelling When Autodesk acquired Berkeley Systems in 1987, it also acquired the B-spline modelling product B-Spline, which Autodesk continued to develop and sell, and also made available as a source code. Autodesk continued to update it until 1991. The B-Spline product included a non-rigid modelling option. In 1993 Autodesk also released a B-spline geometry feature into BIM-RIFT, the first package to provide non-rigid elements. The feature itself was released in Autodesk Inventor 2.1 in 1998. ISO 8613-3 file format The AutoCAD LT 2008 release supports the ISO 8613-3 file format. This standardization format is used by Autodesk with the Advance Layouts and 3D Warehouse. The extension used in the name of the file, ".dwg", stands for Digital Workspace Graphics. The extension stands for something Autodesk designed for CAD, rather than something they designed for Warehouse. The standardization of the file format made it easier for 3D and 2D CAD data from other vendors to be imported into CAD data from Autodesk, rather than having to use a third party vendor's data import program to do so. ObjectARX library Autodesk's release of the ObjectARX API library in 1993 was a major a1d647c40b
