If the user chooses a portion of the image to stretch then you need to have a way to apply the effect only to that portion. A simple and easy to implement solution is to position the square area using X and Y space coordinates and then stretch it. I will demonstrate this using the following mockup. For my example, I am using the following image: Now, let's start with setting up the basic structure of my website. The first step would be to have a template for each blog post and to keep the CSS in its own file. I used to call my CSS file "blog-css.css" and the template file is "blog-post.php". I created a style for each blog post that will be displayed. In the code below, I kept the other properties to their default values, the color is set to #2d2d2d and I changed the background-color to #ffffff so you can see it better. The template file looks like this: Notice how I have a class called "blog-post" that is applied to each paragraph, which will be the content of the blog post. I then set the background-image, font-size and the font-family to this class. The CSS for each post will be much the same: As you can see the CSS is setting the background-image property to be the logo for each post. I kept the CSS for the blog-post as-is because I wanted you to understand how I achieved this effect. To create this effect, I used the CSS attribute "background-image". This property allows you to set a background image for an element. You can use a background-position to position the background image. In my example, the background image is stretching the full width and height of the paragraph. The background-repeat property allows you to set the repeat type of the image. Here I set it to repeat, which means that the image will repeat itself. The value for the background-repeat is set to contain and it will repeat itself to fill the full width and height. The background-position property allows you to position the image. Here I am setting the background-position to center, which means that the image will appear centered in the background. This is the final layout of the blog page: Now that we have completed our website layout,

The interface offers three different sections that let you arrange your photos and slices. "Compose" This is the area where you can add slices. You can either choose images from your computer or drag and drop photos from the library. Once you have added your slices, you can drag and drop them into the area where you want to place them. You can also resize slices, rotate them and move them around. "Align" You can use this area to position slices in the composition or to rearrange them. The interface enables you to add a slice using the cutesy icons. You can also customize the position, rotation and the number of slices per layer by clicking on the alignment icon.
