A user can do their work and play games at the same time, at any time, in any place. So you may say that a user has one all-in-one computer. This is because you can use a computer to do work, and you can play games at the same time. You can have a user-friendly interface and experience, without having to switch between different software programs. A single all-in-one computer will make all of the functions and data of a computer accessible. And at the same time, gaming is one of the main fields of development for a computer, and we can enable high-end gaming experiences with this new development. With the development of hardware technology, there has been increasing demand for integrated computer systems that are able to play video games and allow
