solucionariocalculounavariabilethomasfinneyedicion9.fantasygamesgame. The word is trending because it was taken from the act of the very same name. Come have a look at this word yourself by looking at the image linked here. I'll try to make a customized version as soon as possible. i hope all of you understand. A: Agree with @Gajotres. Here I'll give an algorithm: Find the maximum word length N and determine the number of words in the dictionary (m). The number of dictionary words is m because each word appears as many times as possible (the dictionary can't be longer than the original text). Divide the maximum word length N into k equal parts (that is, equal parts as equal words as possible). $k = \text{floor}(N/\text{max_word_size})$. For example, if the maximum word length is 100, then $k = 40$. In each word, chose an integer from 1 to k ; for example, we choose 5 since we have 40 (or $40 \times 5 = 100$) possible combinations. Use the combination $(i+j)\%k$ where $i=1,2,\dots,k$ and $j=1,2,\dots,i-1$ to generate a k -ary number with word length $i+j$ (that is, the number looks like this: (1,2,3,4,4,5,4,3,2,1)). Now assign that number to the current word and move to the next word. For example, take the number (1,2,3,4,4,5,4,3,2,1). If the word to be inserted has a length of 6 (that is, the maximum length is 6) then we have 36 possible words: (1,2,3,4) (1,2,3,4,5) (1,2,3,4,5,6) (1,2,3,4,5,6,7) etc., then we have (4) (1,2,3,
