KPixen is a great tool for creating and publishing great looking images. It's been around for a long time and is still going strong but it's not always easy to find the features in the help file that really make it such a great piece of software. So we thought it would be useful for people to learn about the features of KPixen so it becomes a little more intuitive. So here's the details and really helpful screenshots. Create Images Using the Great KPixen Picture Builder There are three categories that you have to click through to get to. The first one is all of the default picture types you can use. The first set is quite basic but the rest are the ones you'll get stuck in as you want to make your picture look more professional. A lot of these have features that allow you to modify them with little fiddling. I've had to come back and go through a few times to make mine look great. The second category is also pretty self explanatory but I do have to point out it's pretty much the easiest part. It's just things like icons and logos and such. There is also a graphic design tab that's worth exploring as you can really mess around with the layout to make a great looking picture. It's worth a browse! If you want to use other photo sources to create your picture this category isn't for you. But don't worry there is a camera tab. This lets you add pictures from your camera or smartphone. If you don't have a camera the picture gets taken in to your computer for you. However you have to know exactly where your pictures are stored. You cannot even browse in the standard folders for a change! The third category is to create videos. There are a few video effects and other simple ways of adding some fun to your images. The final result is saved to your computer and can then be uploaded to a few different services. There is a lot more that can be done with KPixen but don't worry about it. There are loads of helpful tutorials on the web and all of them are free to use so you don't really need to worry about learning it.
