Q: How to correctly link FormToEntityFields in an ASP.NET Core MongoDB Migration? How do I correctly use the FormToEntityFields decorator in an ASP.NET Core MongoDB migration? The generator always tries to generate a HasRequiredOneOf relation on the target entity, which is not allowed. As a related question: I would like to know how to correctly use the TargetEntityId in an ASP.NET Core migration. When I provide a value, as in MigrationBuilder.Create.HasRequiredOneOf(i => i.TargetEntity.Id, t => t.Field1, w => w.Field1) for which the Key property of the TargetEntityId property is set to "Field1", it throws an error. However, it also throws an error if the value provided for the Key property is not provided, for example: MigrationBuilder.Create.HasRequiredOneOf(i => i.TargetEntity.Id) In this case, the error is clear enough, but I have no idea what to use instead of i => i.TargetEntity.Id.

A: This is an old question, but I had a similar issue with mongoose's Schema. One solution is simply to ignore the error by just not entering the HasRequiredOneOf. MigrationBuilder.Create.Ignore(e => e.TargetEntity.Id) ... If you're actually using HasRequiredOneOf, you can always change it in the migration by doing something like: MigrationBuilder.Create.HasRequiredOneOf(x => x.TargetEntity.Id, y => y.Field1,
